The CT BRFS team gratefully acknowledges the time contributed by nearly 9,500 citizen volunteers within the State of Connecticut who responded anonymously to the 2023 BRFS. The results presented in this report would not have been possible without their participation.

Introduction

The Connecticut Behavioral Risk Factor Surveillance System (CT BRFSS) is an ongoing, statewide voluntary phone survey of Connecticut citizen volunteers aged 18 and over. It is funded by the Centers for Disease Control and Prevention (CDC) in all 50 states and has been implemented in Connecticut since 1989.

For the 2023 CT BRFSS, the landline sample was a disproportionate stratified random digit dial (RDD) sample, stratified by geography and listed status. Within each contacted household, one adult was randomly selected to be interviewed. The cell phone sample was also stratified RDD sample drawn from dedicated cellular telephone banks with equal probability. An adult contacted by cell phone was eligible to complete the survey if he or she lived in a private residence or college housing either without a landline present or with a landline but with at least 90 percent of all calls received by cell phone. Each month, survey data from Connecticut is sent to CDC for editing and checking. At the end of each year, data are compiled and weighted to represent the state and returned to states for analysis and use in planning and monitoring health programs. Summary data for all states are available on the CDC BRFSS website (<http://www.cdc.gov/BRFSS>).

In 2023, the total sample size of completed interviews for the core survey was 9,501 (land line=1,000; cell phone=8,501). Due to variability in response rates to individual questions and differences in specific sub-populations of interest for particular questions, not all estimates are based on a total sample size of 9,501. Prevalence estimates and 95% confidence intervals (CI) were computed using SAS PROC SURVEYFREQ, which can properly compute variances for complex sampling plans. Any responses of “Not Known/Not sure” or “Refused” were classified as missing.

In an effort to provide the most reliable information possible, coefficients of variation (CV), defined as the ratio of the standard deviation to the mean and serving as a measure of the dispersion of the data points around the mean, were used to assess the validity of each estimate. Prevalence estimates with a CV of between 15% and 20%, inclusive, are marked with a single asterisk (*). Prevalence estimates with a CV between 20.1% and 30%, inclusive, are marked with two asterisks (**) to indicate that caution should be exercised when interpreting these estimates. Prevalence estimates with a CV greater than 30% are suppressed due to poor validity are marked with three asterisks (***). Only comparisons between estimates with non-overlapping 95% confidence intervals should be considered significantly different.

Due to the BRFSS methodology changes that took place in 2011, the estimates provided within the following tables should only be compared to CT BRFSS estimates from 2011-2023 and not to CT BRFSS estimates from years prior to 2011.

If you have any questions regarding any of the estimates within the following tables, please contact Alexander Duarte at Alexander.Duarte@ct.gov. To access the 2023 CT BRFSS questionnaire, please visit the CT BRFSS web page at: www.ct.gov/dph/brfss.
